                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         toxin B subunit (CTB), this sequence is described as unpublished in the specification. The mature CTB protein was used to create hybrid mutants, in which certain amno approximation of CTB were replaced with corresponding as from heat-labile enterotoxin B subunit (LTB), see AAW06606 and AAW06607. The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic fliness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness,

0,

where the antigenic peptide is an inhibin fragment for increasing the fertility of an animal (by increasing levels of follicle stimulating hormone (FSH) or production of sperm or ova), but more generally for inducing an immune response against the antigenic peptide. Vaccines

This is the amino acid sequence of Escherichia coli beta-subunit of heat labile enteritoxin (LTB). It is used in the method of the invention to create fusion proteins which are useful as vaccinating immunogens. The fusion proteins are useful in vaccines, specifically where the antigenic peptide is an inhibin fragment for increasing the

                                              This synthetic Escherichia coli heat-labile toxin (LT) B subunit (LT-B) is encoded by a plant-codon optimized cDNA. The CDNA sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. The second codon is changed from AAT encoding Asn to GTG encoding Val, in order to create a NCOI restriction site at the 5' end. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the
                       production of transgenic plants to produce edible vaccines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic composition elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     adjuvant; anti-bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are particularly administered orally, e.g. fusion protein is expressed in edible plants or animals.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                  Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq

Sequence 4, Application US/09786648

GENERAL INFORMATION:
APPLICANT: Williams, Neil Andrew
APPLICANT: Hirst, Timothy Raymond
TITLE OF INVENTION: Peptide Fragments of Cholera Toxin B or Enterotoxin B as Vacci
TITLE OF INVENTION: Adjuvants
FILE REFERENCE: 7438
                                                                                                                                                                                                                                                                                                                                                                              ORGANISM: E. coli;
FEATURE:
CONTION: 45...65
OTHER INFORMATION: isolated or synthetic EtxB beta4-alpha2 loop fragment derivabl;
OTHER INFORMATION: human variant E. coli

```
A;Title: A unique amino acid sequence of the B subunit of a heat-labile enterotoxin A;Reference number: A61475; MUID:89180953
A;Accession: A61475
A;Molecule type: protein
A;Residues: 22-24,'S',26-27,'E',29-63,'K',65-66,'A',68-95,'A',97-122,'E',124 <TSU>A;Experimental source: strain 240-3
C;Complex: the heat-labile enterotoxin molecule contains one A chain and five or si C;Function:
A;Description: the biological activity of the toxin is produced by the A chain, which contains enterotoxin beta chain
C;Reywords: enterotoxin
C;Reywords: enterotoxin
F;1-21/Domain: signal sequence #status predicted <STG>
F;22-124/Product: heat-labile enterotoxin chain B #status predicted <MAT>
F;30-107/Disulfide bonds: #status predicted
A;Molecule type: DNA
A;Residues: 1-20,'Q',22-31,'Q',33-38,'H',40-49,'G',51-67,'T',69-124
A:Experimental source: classical biotype strain 569B
